

A Connected World

ETSI new activities: E2NA

Mike Sharpe, Sonia Compans

ENHANCING ETSI NETWORK ACTIVITIES (E2NA)

When a cluster gets implemented in the technical organization

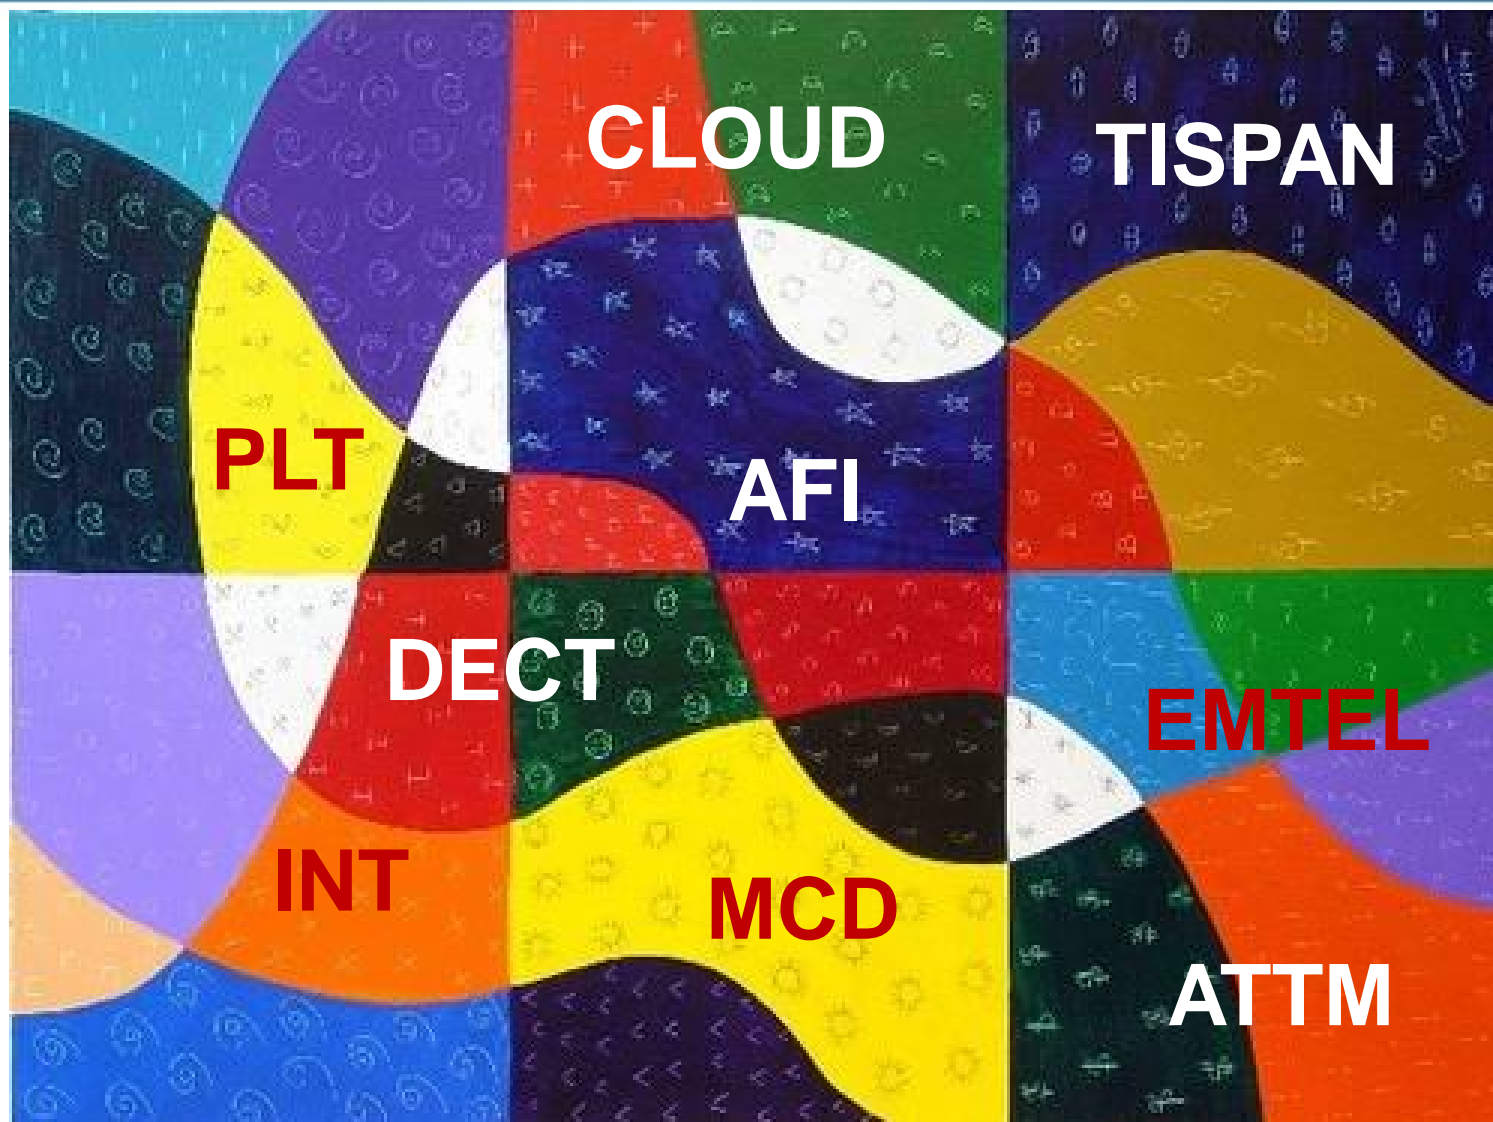

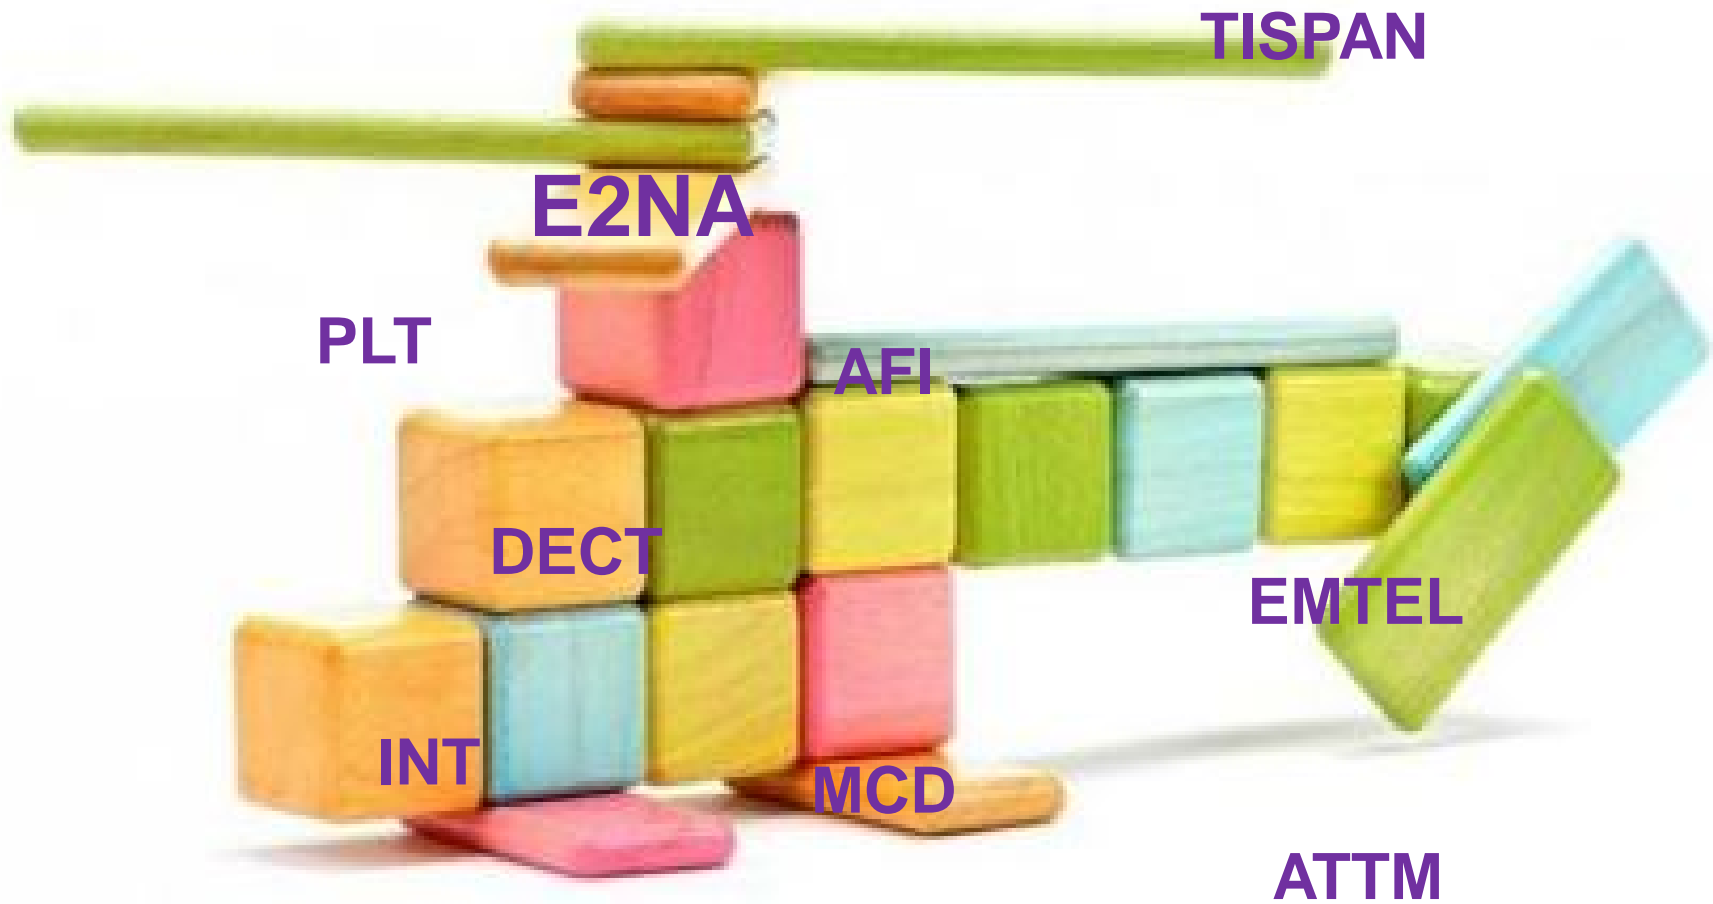

What is the Fixed Networks cluster?

Fixed Networks

Moving...

Fixed Networks

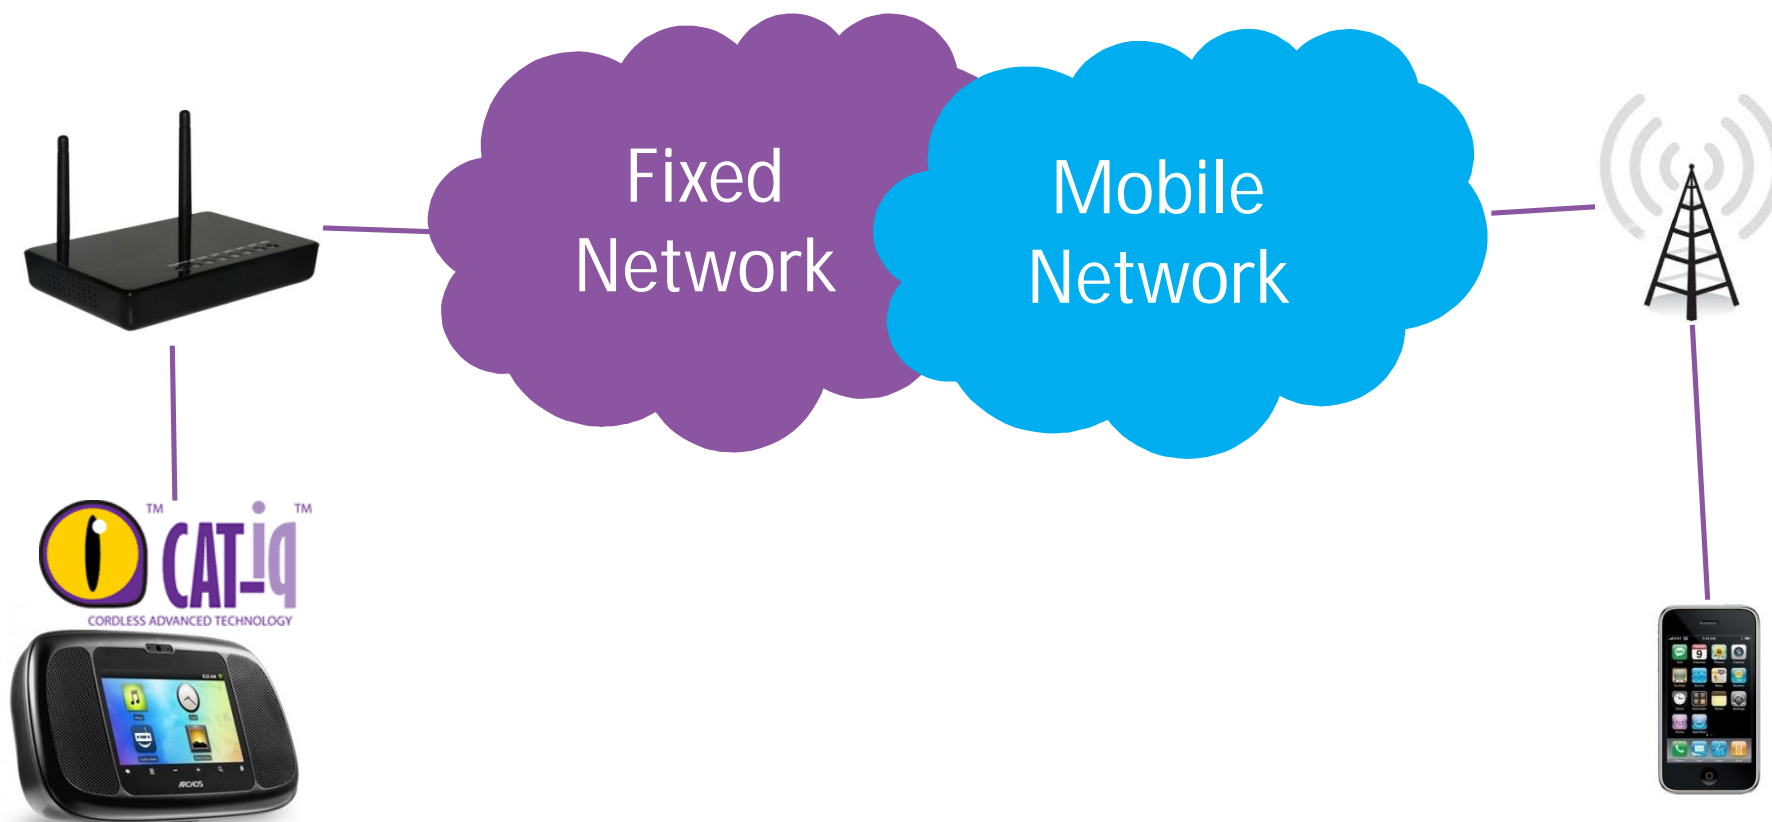

To a set of enablers making communication networks capable of supporting any (end-user) terminal and any service

From fragmented approach

- Build communication networks enabling end-to-end service delivery

E2NA Goal

Fixed Networks

The Sytem

E2NA Scope

Fixed Networks

- Global end-to-end system view
- encompassing terminals, home network, access networks, core networks and application servers, using different technologies
- focal point for network architecture and an overview of network requirements
- complementary to the work of 3GPP
- in cooperation with other external groups including standardization organizations and fora

- **The spirit of 3GPP should be a guidance for creation of an EP working with an architecture view with an end to end vision**
 - Use a planned, system-focussed approach
 - System-based requirements capture
 - Standardization of system architecture and end-to-end system approach
 - Establish & maintain a roadmap (with regular releases) which identifies short-term and medium/long term objectives

E2NA areas of activity

Fixed Networks

- Be responsible for the specifications on the following aspects:
 - Next generation and future networks technologies
 - Architecture and framework for fixed mobile network interconnection
 - Migration across network generations
 - Network Management
 - Numbering Naming Addressing and Routing
 - Testing (conformance, interoperability, performance, security)
 - Security
 - Home network
 - Fixed Access Networks

Current activities to be transferred to E2NA

- Current TCs would transfer their fixed-network standardization activities to this new EP:
 - AFI,
 - TISPAN,
- Independent TCs within the E2NA activity (keeping independence and participating in the OCG)
 - ATTM
 - DECT
 - EMTEL
 - INT (noting that INT covers Network-Network testing also with mobile networks)

Current activities to be considered at a later date

Cloud

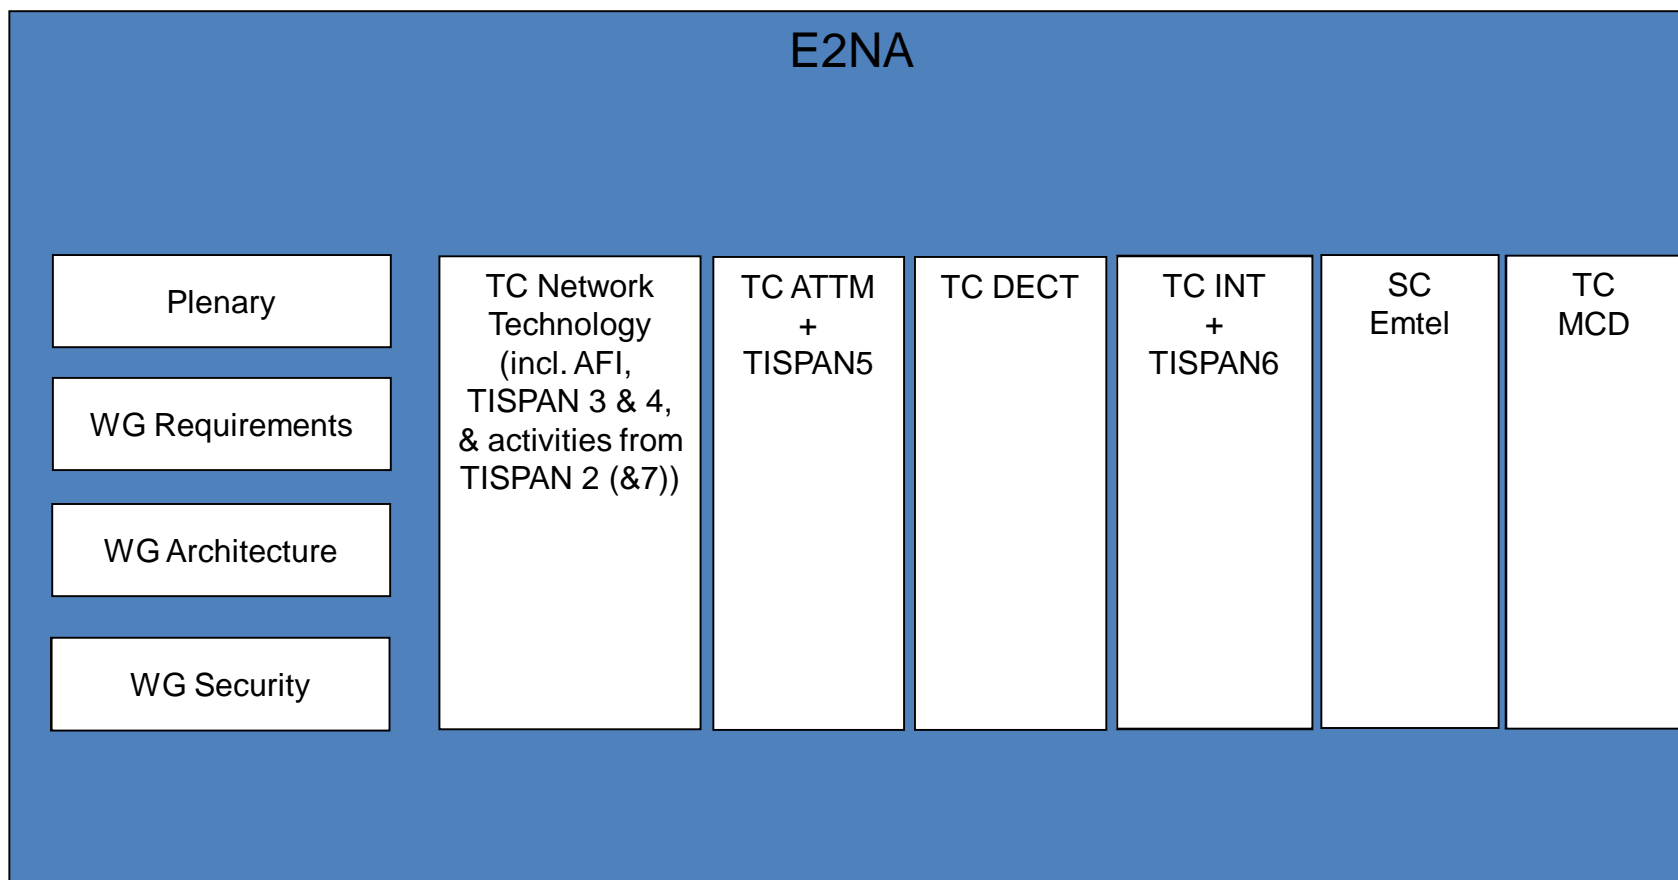

- Future direction & work programme are currently being consolidated
- Current priorities are for layers above the network layer
- APIs may need to be defined as market scenarios are clarified
- Network as a Service is in the scope of E2NA; but no work has started yet
- ➔ It is planned to set up a liaison between E2NA & Cloud to keep the situation under review.

Possible structure Board#87 outcome

Fixed Networks

Note: all other associated TCs will transfer some of their requirements/architecture work to the Requirements and Architecture WG. The actual boundary between these two WGs and the TC/SC will have to be further discussed during the first meetings and revised later if needed.

Overview of E2NA domains

Applications

For E2NA QoS means signalling to ensure an appropriate level of QoS in the network
QoE is signalling to allow an SLA to be negotiated between operators

-  The following members have committed to support EP E2NA and commit resources:
 - Alcatel-Lucent
 - Deutsche Telekom
 - France Telecom
 - Freescale
 - Huawei Technologies Co Ltd
 - Nokia Siemens Networks
 - Orange SA
 - Telecom Italia S.p.A.
 - Telefonica

Thank you for your attention!
